# Data Mining Association Analysis: Basic Concepts and Algorithms 

## Lecture Notes for Chapter 6

Introduction to Data Mining
by
Tan, Steinbach, Kumar

| c Tan,Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ |
| :---: | :---: | :---: |

## Association Rule Mining

- Given a set of transactions, find rules that will predict the occurrence of an item based on the occurrences of other items in the transaction

Market-Basket transactions

| TID | Items |
| :--- | :--- |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

Example of Association Rules
\{Diaper\} $\rightarrow$ \{Beer\},
$\{$ Milk, Bread $\} \rightarrow\{$ Eggs,Coke $\}$, $\{$ Beer, Bread $\} \rightarrow\{$ Milk $\}$,

Implication means co-occurrence, not causality!

## Definition: Frequent Itemset

## - Itemset

- A collection of one or more items
- Example: \{Milk, Bread, Diaper\}
- k-itemset
- An itemset that contains kitems
- Support count ( $\sigma$ )
- Frequency of occurrence of an itemset
- E.g. $\sigma(\{$ Milk, Bread,Diaper\}) $=2$
- Support
- Fraction of transactions that contain an itemset
- E.g. s(\{Milk, Bread, Diaper\}) $=2 / 5$
- Frequent Itemset
- An itemset whose support is greater than or equal to a minsup threshold

| TID | Items |
| :--- | :--- |
| $\mathbf{1}$ | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| $\mathbf{3}$ | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| $\mathbf{5}$ | Bread, Milk, Diaper, Coke |

4 Introduction to Data Mining $\quad 4 / 18 / 2004 \quad 3$

## Definition: Association Rule

- Association Rule
- An implication expression of the form $X \rightarrow Y$, where $X$ and $Y$ are itemsets
- Example:
\{Milk, Diaper\} $\rightarrow$ \{Beer\}
- Rule Evaluation Metrics

| TID | Items |
| :--- | :--- |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

- Support (s)
- Fraction of transactions that contain both X and Y
- Confidence (c)
- Measures how often items in Y appear in transactions that contain X

$$
\begin{aligned}
& s=\frac{\sigma(\text { Milk, Diaper,Beer })}{|\mathrm{T}|}=\frac{2}{5}=0.4 \\
& c=\frac{\sigma(\text { Milk,Diaper,Beer })}{\sigma(\text { Milk, Diaper })}=\frac{2}{3}=0.67
\end{aligned}
$$

## Association Rule Mining Task

- Given a set of transactions T, the goal of association rule mining is to find all rules having
- support $\geq$ minsup threshold
- confidence $\geq$ minconf threshold
- Brute-force approach:
- List all possible association rules
- Compute the support and confidence for each rule
- Prune rules that fail the minsup and minconf thresholds
$\Rightarrow$ Computationally prohibitive!

## Mining Association Rules

| TID | Items |
| :--- | :--- |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

## Example of Rules:

$\{$ Milk,Diaper $\} \rightarrow\{$ Beer $\}$ (s=0.4, c=0.67)
$\{$ Milk,Beer $\} \rightarrow\{$ Diaper $\}(\mathrm{s}=0.4, \mathrm{c}=1.0)$
\{Diaper,Beer\} $\rightarrow$ \{Milk\} (s=0.4, c=0.67)
$\{$ Beer $\} \rightarrow\{$ Milk, Diaper $\}(s=0.4, \mathrm{c}=0.67)$
$\{$ Diaper $\}$ \{Milk,Beer\} (s=0.4, $\mathrm{c}=0.5$ )
$\{$ Milk $\} \rightarrow\{$ Diaper,Beer\} (s=0.4, c=0.5)

## Observations:

- All the above rules are binary partitions of the same itemset:
\{Milk, Diaper, Beer\}
- Rules originating from the same itemset have identical support but can have different confidence
- Thus, we may decouple the support and confidence requirements

| © Tan,Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ |
| :--- | :--- | :--- |

## Mining Association Rules

- Two-step approach:

1. Frequent Itemset Generation

- Generate all itemsets whose support $\geq$ minsup

2. Rule Generation

- Generate high confidence rules from each frequent itemset, where each rule is a binary partitioning of a frequent itemset
- Frequent itemset generation is still computationally expensive

| c Tan,Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ |
| :--- | :--- | :--- |

## Frequent Itemset Generation

## Frequent Itemset Generation

## Brute-force approach:

- Each itemset in the lattice is a candidate frequent itemset
- Count the support of each candidate by scanning the database

Transactions

| TID | Items |
| :---: | :---: |
| 1 | Bread, Milk |
| 2 | Bread, Diaper, Beer, Eggs |
| 3 | Milk, Diaper, Beer, Coke |
| 4 | Bread, Milk, Diaper, Beer |
| 5 | Bread, Milk, Diaper, Coke |

List of

- Match each transaction against every candidate
- Complexity ~ O(NMw) => Expensive since $M=2$ d !!!

| © Tan,Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ | 9 |
| :--- | :--- | :--- | :--- |

## Computational Complexity

- Given d unique items:
- Total number of itemsets $=2^{\mathrm{d}}$
- Total number of possible association rules:

## Frequent Itemset Generation Strategies

- Reduce the number of candidates (M)
- Complete search: $\mathrm{M}=2^{\text {d }}$
- Use pruning techniques to reduce M
- Reduce the number of transactions (N)
- Reduce size of N as the size of itemset increases
- Used by DHP and vertical-based mining algorithms
- Reduce the number of comparisons (NM)
- Use efficient data structures to store the candidates or transactions
- No need to match every candidate against every transaction

## Reducing Number of Candidates

## - Apriori principle:

- If an itemset is frequent, then all of its subsets must also be frequent
- Apriori principle holds due to the following property of the support measure:

$$
\forall X, Y:(X \subseteq Y) \Rightarrow s(X) \geq s(Y)
$$

- Support of an itemset never exceeds the support of its subsets
- This is known as the anti-monotone property of support

## Illustrating Apriori Principle

Found to be Infrequent

## Illustrating Apriori Principle

## Apriori Algorithm

## - Method:

- Let $\mathrm{k}=1$
- Generate frequent itemsets of length 1
- Repeat until no new frequent itemsets are identified
- Generate length $(k+1)$ candidate itemsets from length $k$ frequent itemsets
- Prune candidate itemsets containing subsets of length $k$ that are infrequent
- Count the support of each candidate by scanning the DB
- Eliminate candidates that are infrequent, leaving only those that are frequent

## Reducing Number of Comparisons

## - Candidate counting:

- Scan the database of transactions to determine the support of each candidate itemset
- To reduce the number of comparisons, store the candidates in a hash structure
- Instead of matching each transaction against every candidate, match it against candidates contained in the hashed buckets

Transactions Hash Structure

Buckets

| © Tan,Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ | 16 |
| :--- | :--- | :--- | :--- |

## Generate Hash Tree

Suppose you have 15 candidate itemsets of length 3:
$\{14$ 5\}, \{1 2 4\}, \{4 5 7\}, \{1 2 5\}, \{4 5 8\}, \{1 5 9\}, \{1 3 6\}, \{2 3 4\}, \{5 67$\}$, \{3 4 5\}, $\{35$ 6\}, \{3 5 7\}, \{6 8 9\}, \{3 6 7\}, \{3 6 8\}
You need:

- Hash function
- Max leaf size: max number of itemsets stored in a leaf node (if number of candidate itemsets exceeds max leaf size, split the node)

| Hash function |  |  |  |
| :---: | :---: | :---: | :---: |
| O Tan,Steinbach, Kumar | Introduction to Data Mining | 4/18/2004 | 17 |

## Association Rule Discovery: Hash tree

## Association Rule Discovery: Hash tree

## Association Rule Discovery: Hash tree

## Subset Operation

Given a transaction t , what are the possible subsets of size 3 ?

Level 3
Subsets of 3 items

## Subset Operation Using Hash Tree

## Subset Operation Using Hash Tree

## Subset Operation Using Hash Tree

## Factors Affecting Complexity

- Choice of minimum support threshold
- lowering support threshold results in more frequent itemsets
- this may increase number of candidates and max length of frequent itemsets
- Dimensionality (number of items) of the data set
- more space is needed to store support count of each item
- if number of frequent items also increases, both computation and I/O costs may also increase
- Size of database
- since Apriori makes multiple passes, run time of algorithm may increase with number of transactions
- Average transaction width
- transaction width increases with denser data sets
- This may increase max length of frequent itemsets and traversals of hash tree (number of subsets in a transaction increases with its width)

## Compact Representation of Frequent Itemsets

- Some itemsets are redundant because they have identical support as their supersets

| TID | A1 | A2 | A3 | A4 | A5 | A6 | A7 | A8 | A9 | A10 | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | C1 | C2 | C3 | C4 | C5 | C6 | C7 | C8 | C9 | C10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| B | ------ |
| C | .------ |
| D |  |
| E | ------ |

Transaction
Database

## FP-growth

Conditional Pattern base for D:

$$
P=\{(A: 1, B: 1, C: 1),
$$

(A:1,B:1),
(A:1,C:1),
(A:1),
(B:1,C:1)\}
Recursively apply FPgrowth on $P$

Frequent Itemsets found (with sup > 1):
AD, BD, CD, ACD, BCD

| c Tan,Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ |
| :---: | :---: | :---: |

## Tree Projection

## Tree Projection

- Items are listed in lexicographic order
- Each node P stores the following information:
- Itemset for node P
- List of possible lexicographic extensions of $P: E(P)$
- Pointer to projected database of its ancestor node
- Bitvector containing information about which transactions in the projected database contain the itemset

## Projected Database

## Projected Database

Original Database:

| TID | Items |
| :---: | :---: |
| 1 | $\{A, B\}$ |
| 2 | $\{B, C, D\}$ |
| 3 | $\{A, C, D, E\}$ |
| 4 | $\{A, D, E\}$ |
| 5 | $\{A, B, C\}$ |
| 6 | $\{A, B, C, D\}$ |
| 7 | $\{B, C\}$ |
| 8 | $\{A, B, C\}$ |
| 9 | $\{A, B, D\}$ |
| 10 | $\{B, C, E\}$ |

for node A:

| TID | Items |
| :---: | :---: |
| 1 | $\{B\}$ |
| 2 | $\}$ |
| 3 | $\{C, D, E\}$ |
| 4 | $\{D, E\}$ |
| 5 | $\{B, C\}$ |
| 6 | $\{B, C, D\}$ |
| 7 | $\}$ |
| 8 | $\{B, C\}$ |
| 9 | $\{B, D\}$ |
| 10 | $\}$ |

For each transaction $T$, projected transaction at node $A$ is $T \cap E(A)$

## ECLAT

- For each item, store a list of transaction ids (tids)

Horizontal

| Dat | Layout | Vertical Data Layout |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TID | Items | A | B | C | D | E |
| 1 | A,B,E | 1 | 1 | 2 | 2 | 1 |
| 2 | B,C,D | 4 | 2 | 3 | 4 | 3 |
| 3 | C, E | 5 | 5 | 4 | 5 | 6 |
| 4 | A, C, D | 6 | 7 | 8 | 9 |  |
| 5 | A,B,C,D | 7 | 8 | 9 |  |  |
| 6 | A, E | 8 | 10 |  |  |  |
| 7 | A, B | 9 |  |  |  |  |
| 8 | A,B,C |  |  |  |  |  |
| 9 | A, C, D | $\checkmark$ |  |  |  |  |
| 10 | B |  |  |  |  |  |

[^0]
## ECLAT

- Determine support of any k-itemset by intersecting tid-lists of two of its (k-1) subsets.

| A |
| :--- |
| 1 |
| 4 |
| 5 |
| 6 |
| 7 |
| 8 |
| 9 |

$\wedge$| B |
| :---: |
| 1 |
|  |
|  |
|  |
|  |
|  |
|  |

$\longrightarrow$| $A B$ |
| :---: |
| 1 |
| 5 |
| 7 |
| 8 |

- 3 traversal approaches:
- top-down, bottom-up and hybrid
- Advantage: very fast support counting
- Disadvantage: intermediate tid-lists may become too large for memory

## Rule Generation

- Given a frequent itemset L, find all non-empty subsets $f \subset L$ such that $f \rightarrow L-f$ satisfies the minimum confidence requirement
- If $\{A, B, C, D\}$ is a frequent itemset, candidate rules:

| $A B C \rightarrow D$, | $A B D \rightarrow C$, | $A C D \rightarrow B$, | $B C D \rightarrow A$, |
| :--- | :--- | :--- | :--- |
| $A \rightarrow B C D$, | $B \rightarrow A C D$, | $C \rightarrow A B D$, | $D \rightarrow A B C$ |
| $A B \rightarrow C D$, | $A C \rightarrow B D$, | $A D \rightarrow B C$, | $B C \rightarrow A D$, |
| $B D \rightarrow A C$, | $C D \rightarrow A B$, |  |  |

- If $\mid$ 니 $=k$, then there are $2^{k}-2$ candidate association rules (ignoring $\mathrm{L} \rightarrow \varnothing$ and $\varnothing \rightarrow \mathrm{L}$ )
© Tan,Steinbach, Kumar

## Rule Generation

How to efficiently generate rules from frequent itemsets?

- In general, confidence does not have an antimonotone property

$$
\mathrm{c}(\mathrm{ABC} \rightarrow \mathrm{D}) \text { can be larger or smaller than } \mathrm{c}(\mathrm{AB} \rightarrow \mathrm{D})
$$

- But confidence of rules generated from the same itemset has an anti-monotone property
- e.g., $L=\{A, B, C, D\}$ :

$$
\mathrm{c}(\mathrm{ABC} \rightarrow \mathrm{D}) \geq \mathrm{c}(\mathrm{AB} \rightarrow \mathrm{CD}) \geq \mathrm{c}(\mathrm{~A} \rightarrow \mathrm{BCD})
$$

- Confidence is anti-monotone w.r.t. number of items on the RHS of the rule

## Rule Generation for Apriori Algorithm

## Rule Generation for Apriori Algorithm

- Candidate rule is generated by merging two rules that share the same prefix in the rule consequent
- join(CD=>AB, $B D=>A C)$ would produce the candidate rule $D=>A B C$

- Prune rule $D=>A B C$ if its subset $A D=>B C$ does not have high confidence

## Effect of Support Distribution

- Many real data sets have skewed support distribution

Support distribution of a retail data set

## Effect of Support Distribution

- How to set the appropriate minsup threshold?
- If minsup is set too high, we could miss itemsets involving interesting rare items (e.g., expensive products)
- If minsup is set too low, it is computationally expensive and the number of itemsets is very large
- Using a single minimum support threshold may not be effective

## Multiple Minimum Support

- How to apply multiple minimum supports?
- MS(i): minimum support for item i
- e.g.: MS(Milk)=5\%, MS(Coke) $=3 \%$,

MS(Broccoli) $=0.1 \%, \quad \mathrm{MS}($ Salmon $)=0.5 \%$

- MS(\{Milk, Broccoli\}) $=$ min (MS(Milk), MS(Broccoli))

$$
=0.1 \%
$$

- Challenge: Support is no longer anti-monotone
- Suppose: Support(Milk, Coke) $=1.5 \%$ and

Support(Milk, Coke, Broccoli) $=0.5 \%$

- \{Milk,Coke\} is infrequent but \{Milk,Coke,Broccoli\} is frequent

| © Tan,Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ | 51 |
| :--- | :--- | :--- | :--- |

## Multiple Minimum Support

## Multiple Minimum Support

## Multiple Minimum Support (Liu 1999)

- Order the items according to their minimum support (in ascending order)
- e.g.: MS(Milk) $=5 \%, \quad$ MS(Coke) $=3 \%$,
$\mathrm{MS}($ Broccoli) $=0.1 \%, \quad \mathrm{MS}($ Salmon $)=0.5 \%$
- Ordering: Broccoli, Salmon, Coke, Milk
- Need to modify Apriori such that:
$-L_{1}$ : set of frequent items
$-F_{1}$ : set of items whose support is $\geq M S(1)$ where $\mathrm{MS}(1)$ is $\min _{\mathrm{i}}(\mathrm{MS}(\mathrm{i})$ )
$-C_{2}$ : candidate itemsets of size 2 is generated from $F_{1}$ instead of $L_{1}$

## Multiple Minimum Support (Liu 1999)

- Modifications to Apriori:
- In traditional Apriori,
- A candidate $(k+1)$-itemset is generated by merging two frequent itemsets of size $k$
- The candidate is pruned if it contains any infrequent subsets of size $k$
- Pruning step has to be modified:
- Prune only if subset contains the first item
- e.g.: Candidate=\{Broccoli, Coke, Milk\} (ordered according to minimum support)
- \{Broccoli, Coke\} and \{Broccoli, Milk\} are frequent but \{Coke, Milk\} is infrequent
- Candidate is not pruned because \{Coke,Milk\} does not contain the first item, i.e., Broccoli.

## Pattern Evaluation

- Association rule algorithms tend to produce too many rules
- many of them are uninteresting or redundant
- Redundant if $\{A, B, C\} \rightarrow\{D\}$ and $\{A, B\} \rightarrow\{D\}$ have same support \& confidence

Interestingness measures can be used to prune/rank the derived patterns

- In the original formulation of association rules, support \& confidence are the only measures used

## Application of Interestingness Measure

## Computing Interestingness Measure

- Given a rule $\mathrm{X} \rightarrow \mathrm{Y}$, information needed to compute rule interestingness can be obtained from a contingency table

Contingency table for $\mathrm{X} \rightarrow \mathrm{Y}$

|  | $Y$ | $\bar{Y}$ |  |
| :---: | :---: | :---: | :---: |
| $X$ | $f_{11}$ | $f_{10}$ | $f_{1+}$ |
| $\bar{X}$ | $f_{01}$ | $f_{00}$ | $f_{0+}$ |
|  | $f_{+1}$ | $f_{+0}$ | $\|T\|$ |

$f_{11}:$ support of $X$ and $Y$
$f_{10}:$ support of $X$ and $\bar{Y}$
$f_{010}:$ support of $X$ and $Y$
$f_{00}$ : support of $\bar{X}$ and $\bar{Y}$

Used to define various measures

- support, confidence, lift, Gini, J-measure, etc.

## Drawback of Confidence

|  |  |  |  |
| :---: | :---: | :---: | :---: |
|  | Coffee | Coffee |  |
| Tea | 15 | 5 | 20 |
| $\overline{\text { Tea }}$ | 75 | 5 | 80 |
|  | 90 | 10 | 100 |

## Association Rule: Tea $\rightarrow$ Coffee

Confidence $=P($ Coffee $\mid$ Tea $)=0.75$
but $P($ Coffee $)=0.9$
$\Rightarrow$ Although confidence is high, rule is misleading
$\Rightarrow \mathrm{P}($ Coffee $\mid \overline{\text { Tea }})=0.9375$

## Statistical Independence

- Population of 1000 students
- 600 students know how to swim (S)
- 700 students know how to bike (B)
- 420 students know how to swim and bike (S,B)
- $P(S \wedge B)=420 / 1000=0.42$
$-P(S) \times P(B)=0.6 \times 0.7=0.42$
$-P(S \wedge B)=P(S) \times P(B)=>$ Statistical independence
- $P(S \wedge B)>P(S) \times P(B)=>$ Positively correlated
- $P(S \wedge B)<P(S) \times P(B)=>$ Negatively correlated

## Statistical-based Measures

- Measures that take into account statistical dependence

Lift $=\frac{P(Y \mid X)}{P(Y)}$
Interest $=\frac{P(X, Y)}{P(X) P(Y)}$
$P S=P(X, Y)-P(X) P(Y)$
$\phi-$ coefficient $=\frac{P(X, Y)-P(X) P(Y)}{\sqrt{P(X)[1-P(X)] P(Y)[1-P(Y)]}}$

## Example: Lift/Interest

|  |  |  |  |
| :---: | :---: | :---: | :---: |
|  | Coffee | Coffee |  |
| Tea | 15 | 5 | 20 |
| $\overline{\text { Tea }}$ | 75 | 5 | 80 |
|  | 90 | 10 | 100 |

Association Rule: Tea $\rightarrow$ Coffee

Confidence $=P($ Coffee $\mid$ Tea $)=0.75$
but $P($ Coffee $)=0.9$
$\Rightarrow$ Lift $=0.75 / 0.9=0.8333(<1$, therefore is negatively associated $)$

## Drawback of Lift \& Interest

|  | Y | $\overline{\mathrm{Y}}$ |  |
| :---: | :---: | :---: | :---: |
| X | 10 | 0 | 10 |
| $\overline{\mathrm{X}}$ | 0 | 90 | 90 |
|  | 10 | 90 | 100 |

$$
\text { Lift }=\frac{0.1}{(0.1)(0.1)}=10
$$

|  | Y | $\overline{\mathrm{Y}}$ |  |
| :---: | :---: | :---: | :---: |
| X | 90 | 0 | 90 |
| $\overline{\mathrm{X}}$ | 0 | 10 | 10 |
|  | 90 | 10 | 100 |

$$
\text { Lift }=\frac{0.9}{(0.9)(0.9)}=1.11
$$

Statistical independence:

$$
\text { If } P(X, Y)=P(X) P(Y)=>\text { Lift }=1
$$

|  | 16 | Piatetsky-Shapiro's (PS) | $P(A, B)-P(A) P(B)$ |
|  | 17 | Certainty factor (F) | $\max \left(\frac{P(B \mid A)-P(B)}{1-P(B)}, \frac{P(A \mid B)-P(A)}{1-P(A)}\right)$ |
|  | 18 | Added Value ( $A V$ ) | $\max (P(B \mid A)-P(B), P(A \mid B)-P(A))$ |
|  | 19 | Collective strength ( $S$ ) | $\frac{P(A, B)+P(\overline{A B})}{P(A) P(B)+P(\bar{A}) P(\bar{B})} \times \frac{1-P(A) P(B)-P(\bar{A}) P(\bar{B})}{1-P(A, B)-P(\overline{A B})}$ |
|  | 20 | Jaccard ( $\zeta$ ) | $\frac{P(A)+P(B) B}{P(B)-P(A, B)}$ |
|  | 21 | Klosgen ( $K$ ) | $\sqrt{P(A, B)} \max (P(B \mid A)-P(B), P(A \mid B)-P(A))$ |

## Properties of A Good Measure

- Piatetsky-Shapiro:

3 properties a good measure $M$ must satisfy:
$-M(A, B)=0$ if $A$ and $B$ are statistically independent

- $M(A, B)$ increase monotonically with $P(A, B)$ when $P(A)$ and $P(B)$ remain unchanged
- $M(A, B)$ decreases monotonically with $P(A)$ [or $P(B)]$ when $P(A, B)$ and $P(B)$ [or $P(A)]$ remain unchanged

## Comparing Different Measures

## Property under Variable Permutation

|  | $\mathbf{A}$ | $\overline{\mathbf{A}}$ |
| :---: | :---: | :---: |
| $\mathbf{B}$ | p | r |
| $\overline{\mathbf{B}}$ | q | s |

Does $M(A, B)=M(B, A)$ ?
Symmetric measures:

- support, lift, collective strength, cosine, Jaccard, etc Asymmetric measures:
- confidence, conviction, Laplace, J-measure, etc

| c Tan,Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ |
| :--- | :--- | :--- |

## Property under Row/Column Scaling

Grade-Gender Example (Mosteller, 1968):

|  | Male | Female |  |
| :---: | :---: | :---: | :---: |
| High | 2 | 3 | 5 |
| Low | 1 | 4 | 5 |
|  | 3 | 7 | 10 |

|  | Male | Female |  |
| :---: | :---: | :---: | :---: |
| High | 4 | 30 | 34 |
| Low | 2 | 40 | 42 |
|  | 6 | 70 | 76 |
|  | $\downarrow$ | $\downarrow$ |  |
|  | $2 x$ | $10 x$ |  |

Mosteller:
Underlying association should be independent of the relative number of male and female students in the samples

## Property under Inversion Operation

(a)

(b)

(c)

## Example: $\phi$-Coefficient

- $\phi$-coefficient is analogous to correlation coefficient for continuous variables

|  | Y | $\bar{Y}$ |  |
| :---: | :---: | :---: | :---: |
| X | 60 | 10 | 70 |
| $\bar{X}$ | 10 | 20 | 30 |
|  | 70 | 30 | 100 |

|  | Y | $\overline{\mathrm{Y}}$ |  |
| :---: | :---: | :---: | :---: |
| X | 20 | 10 | 30 |
| $\overline{\mathrm{X}}$ | 10 | 60 | 70 |
|  | 30 | 70 | 100 |

$$
\begin{aligned}
\phi & =\frac{0.6-0.7 \times 0.7}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}} & \phi & =\frac{0.2-0.3 \times 0.3}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}} \\
& =0.5238 & & =0.5238
\end{aligned}
$$

$\phi$ Coefficient is the same for both tables

## Property under Null Addition

|  | $\mathbf{B}$ | $\overline{\mathbf{B}}$ |
| :---: | :---: | :---: |
| $\mathbf{A}$ | p | q |
| $\overline{\mathbf{A}}$ | r | s |

|  | $\mathbf{B}$ | $\overline{\mathbf{B}}$ |
| :---: | :---: | :---: |
| $\mathbf{A}$ | p | q |
| $\overline{\mathbf{A}}$ | r | $\mathrm{s}+\mathrm{k}$ |

Invariant measures:

- support, cosine, Jaccard, etc

Non-invariant measures:

- correlation, Gini, mutual information, odds ratio, etc

| c Tan, Steinbach, Kumar | Introduction to Data Mining | $4 / 18 / 2004$ |
| :--- | :--- | :--- |

## Different Measures have Different Properties

| Sym bol | Measure | Range | P1 | P2 | P3 | 01 | O2 | O3 | O3' | 04 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\Phi$ | Correlation | $-1 \ldots 0 \ldots 1$ | Yes | Yes | Yes | Yes | No | Yes | Yes | No |
| $\lambda$ | Lambda | $0 \ldots 1$ | Yes | No | No | Yes | No | No* | Yes | No |
| $\alpha$ | Odds ratio | $0 \ldots 1 \ldots \infty$ | Yes* | Yes | Yes | Yes | Yes | Yes* | Yes | No |
| Q | Yule's Q | $-1 \ldots 0 \ldots 1$ | Yes | Yes | Yes | Yes | Yes | Yes | Yes | No |
| Y | Yule's Y | -1... $0 \ldots 1$ | Yes | Yes | Yes | Yes | Yes | Yes | Yes | No |
| $\kappa$ | Cohen's | $-1 \ldots 0 \ldots 1$ | Yes | Yes | Yes | Yes | No | No | Yes | No |
| M | Mutual Information | $0 \ldots 1$ | Yes | Yes | Yes | Yes | No | No* | Yes | No |
| J | J-Measure | $0 \ldots 1$ | Yes | No | No | No | No | No | No | No |
| G | Gini Index | $0 \ldots 1$ | Yes | No | No | No | No | No* | Yes | No |
| S | Support | $0 \ldots 1$ | No | Yes | No | Yes | No | No | No | No |
| C | Confidence | $0 \ldots 1$ | No | Yes | No | Yes | No | No | No | Yes |
| L | Laplace | $0 \ldots 1$ | No | Yes | No | Yes | No | No | No | No |

| I | Interest | $0 \ldots 1 \ldots \infty$ | Yes* | Yes | Yes | Yes | No | No | No | No |
| IS | IS (cosine) | $0 . .1$ | No | Yes | Yes | Yes | No | No | No | Yes |
| PS | Piatetsky-Shapiro's | $-0.25 \ldots 0 \ldots 0.25$ | Yes | Yes | Yes | Yes | No | Yes | Yes | No |
| F | Certainty factor | -1... $0 . .1$ | Yes | Yes | Yes | No | No | No | Yes | No |
| AV | Added value | $0.5 \ldots 1 \ldots 1$ | Yes | Yes | Yes | No | No | No | No | No |
| S | Collective strength | $0 \ldots 1 \ldots \infty$ | No | Yes | Yes | Yes | No | Yes* | Yes | No |
| $\zeta$ | Jaccard | $0 . .1$ | No | Yes | Yes | Yes | No | No | No | Yes |
| K | Klosgen's | $\left(\sqrt{\frac{2}{\sqrt{3}}-1}\right)\left(2-\sqrt{3}-\frac{1}{\sqrt{3}}\right) \ldots 0 \ldots \frac{2}{3 \sqrt{3}}$ | Yes | Yes | Yes | No | No | No | No | No |

## Support-based Pruning

- Most of the association rule mining algorithms use support measure to prune rules and itemsets
- Study effect of support pruning on correlation of itemsets
- Generate 10000 random contingency tables
- Compute support and pairwise correlation for each table
- Apply support-based pruning and examine the tables that are removed

## Effect of Support-based Pruning

## Effect of Support-based Pruning

## Effect of Support-based Pruning

- Investigate how support-based pruning affects other measures
- Steps:
- Generate 10000 contingency tables
- Rank each table according to the different measures
- Compute the pair-wise correlation between the measures

## Effect of Support-based Pruning

- Without Support Pruning (All Pairs)

Scatter Plot between Correlation \& Jaccard Measure
-Red cells indicate correlation between the pair of measures $>0.85$

- 40.14\% pairs have correlation > 0.85

## Effect of Support-based Pruning

## Effect of Support-based Pruning

- $0.5 \%$ s support $\leq 30 \%$

$76.42 \%$ pairs have correlation $>0.85$

Scatter Plot between Correlation \& Jaccard Measure

## Subjective Interestingness Measure

- Objective measure:
- Rank patterns based on statistics computed from data
- e.g., 21 measures of association (support, confidence, Laplace, Gini, mutual information, Jaccard, etc).
- Subjective measure:
- Rank patterns according to user's interpretation
- A pattern is subjectively interesting if it contradicts the expectation of a user (Silberschatz \& Tuzhilin)
- A pattern is subjectively interesting if it is actionable (Silberschatz \& Tuzhilin)

## Interestingness via Unexpectedness

- Need to model expectation of users (domain knowledge)

+ Pattern expected to be frequent
- Pattern expected to be infrequent
$\square$ Pattern found to be frequent
Pattern found to be infrequent
+     - Expected Patterns
$-\quad$ U Unexpected Patterns
- Need to combine expectation of users with evidence from data (i.e., extracted patterns)

## Interestingness via Unexpectedness

- Web Data (Cooley et al 2001)
- Domain knowledge in the form of site structure
- Given an itemset $F=\left\{X_{1}, X_{2}, \ldots, X_{k}\right\}\left(X_{i}:\right.$ Web pages $)$
- $L$ : number of links connecting the pages
- Ifactor $=\mathrm{L} /(\mathrm{k} \times \mathrm{k}-1)$
- cfactor $=1$ (if graph is connected), 0 (disconnected graph)
- Structure evidence $=$ cfactor $\times$ Ifactor
- Usage evidence $=\frac{P\left(X_{1} \cap X_{2} \cap \ldots \cap X_{k}\right)}{P\left(X_{1} \cup X_{2} \cup \ldots \cup X_{k}\right)}$
- Use Dempster-Shafer theory to combine domain knowledge and evidence from data
