

Data Mining

Lecture Notes for Chapter 4

Artificial Neural Networks

Introduction to Data Mining , 2nd Edition

by

Tan, Steinbach, Karpatne, Kumar

1

Artificial Neural Networks (ANN)

- **Basic Idea:** A complex non-linear function can be learned as a composition of simple processing units
- ANN is a collection of simple processing units (nodes) that are connected by directed links (edges)
 - Every node receives signals from incoming edges, performs computations, and transmits signals to outgoing edges
 - Analogous to *human brain* where nodes are neurons and signals are electrical impulses
 - Weight of an edge determines the strength of connection between the nodes
- Simplest ANN: **Perceptron** (single neuron)

2

Basic Architecture of Perceptron

$$y = \begin{cases} 1, & \text{if } \mathbf{w}^T \mathbf{x} + b > 0. \\ -1, & \text{otherwise.} \end{cases}$$

$$\tilde{\mathbf{w}} = (\mathbf{w}^T \ b)^T \quad \tilde{\mathbf{x}} = (\mathbf{x}^T \ 1)^T$$

$$\hat{y} = \text{sign}(\tilde{\mathbf{w}}^T \tilde{\mathbf{x}})$$

Activation Function

- Learns linear decision boundaries
- Related to logistic regression (activation function is sign instead of sigmoid)

3

Perceptron Example

X_1	X_2	X_3	Y
1	0	0	-1
1	0	1	1
1	1	0	1
1	1	1	1
0	0	1	-1
0	1	0	-1
0	1	1	1
0	0	0	-1

Output Y is 1 if at least two of the three inputs are equal to 1.

4

Perceptron Example

X_1	X_2	X_3	Y
1	0	0	-1
1	0	1	1
1	1	0	1
1	1	1	1
0	0	1	-1
0	1	0	-1
0	1	1	1
0	0	0	-1

$$Y = \text{sign}(0.3X_1 + 0.3X_2 + 0.3X_3 - 0.4)$$

$$\text{where } \text{sign}(x) = \begin{cases} 1 & \text{if } x \geq 0 \\ -1 & \text{if } x < 0 \end{cases}$$

5

Perceptron Learning Rule

- Initialize the weights (w_0, w_1, \dots, w_d)
- Repeat
 - For each training example (x_i, y_i)

- ◆ Compute \hat{y}_i
- ◆ Update the weights:

$$w_j^{(k+1)} = w_j^{(k)} + \lambda(y_i - \hat{y}_i^{(k)})x_{ij}$$

- Until stopping condition is met
- k: iteration number; λ : learning rate

6

Perceptron Learning Rule

- Weight update formula:

$$w_j^{(k+1)} = w_j^{(k)} + \lambda(y_i - \hat{y}_i^{(k)})x_{ij}$$

- Intuition:

– Update weight based on error: $e = (y_i - \hat{y}_i)$

◆ If $y = \hat{y}$, $e=0$: no update needed

◆ If $y > \hat{y}$, $e=2$: weight must be increased (assuming x_{ij} is positive) so that \hat{y} will increase

◆ If $y < \hat{y}$, $e=-2$: weight must be decreased (assuming x_{ij} is positive) so that \hat{y} will decrease

7

Example of Perceptron Learning

$$\lambda = 0.1$$

X_1	X_2	X_3	Y
1	0	0	-1
1	0	1	1
1	1	0	1
1	1	1	1
0	0	1	-1
0	1	0	-1
0	1	1	1
0	0	0	-1

	w_0	w_1	w_2	w_3
0	0	0	0	0
1	-0.2	-0.2	0	0
2	0	0	0	0.2
3	0	0	0	0.2
4	0	0	0	0.2
5	-0.2	0	0	0
6	-0.2	0	0	0
7	0	0	0.2	0.2
8	-0.2	0	0.2	0.2

Epoch	w_0	w_1	w_2	w_3
0	0	0	0	0
1	-0.2	0	0.2	0.2
2	-0.2	0	0.4	0.2
3	-0.4	0	0.4	0.2
4	-0.4	0.2	0.4	0.4
5	-0.6	0.2	0.4	0.2
6	-0.6	0.4	0.4	0.2

Weight updates over first epoch

Weight updates over all epochs

8

Perceptron Learning

- Since y is a linear combination of input variables, decision boundary is linear

Nonlinearly Separable Data

For nonlinearly separable problems, perceptron learning algorithm will fail because no linear hyperplane can separate the data perfectly

$$y = x_1 \oplus x_2$$

x_1	x_2	y
0	0	-1
1	0	1
0	1	1
1	1	-1

Multi-layer Neural Network

- More than one *hidden layer* of computing nodes
- Every node in a hidden layer operates on activations from preceding layer and transmits activations forward to nodes of next layer
- Also referred to as “feedforward neural networks”

11

Multi-layer Neural Network

- Multi-layer neural networks with at least one hidden layer can solve any type of classification task involving nonlinear decision surfaces

XOR Data

12

Why Multiple Hidden Layers?

- Activations at hidden layers can be viewed as features extracted as functions of inputs
- Every hidden layer represents a level of abstraction
 - *Complex features are compositions of simpler features*

- Number of layers is known as **depth** of ANN
 - *Deeper networks express complex hierarchy of features*

13

Multi-Layer Network Architecture

$$a_i^l = f(z_i^l) = f\left(\underbrace{\sum_j w_{ij}^l a_j^{l-1}}_{\text{Linear Predictor}} + b_i^l\right)$$

Activation value at node i at layer l Activation Function Linear Predictor

14

Activation Functions

$$a_i^l = f(z_i^l) = f\left(\sum_j w_{ij}^l a_j^{l-1} + b_i^l\right)$$

$$a_i^l = \sigma(z_i^l) = \frac{1}{1 + e^{-z_i^l}}$$
$$\frac{\partial a_i^l}{\partial z_i^l} = \frac{\partial \sigma(z_i^l)}{\partial z_i^l} = a_i^l(1 - a_i^l)$$

Learning Multi-layer Neural Network

- Can we apply perceptron learning rule to each node, including hidden nodes?
 - Perceptron learning rule computes error term $e = y - \hat{y}$ and updates weights accordingly
 - ◆ Problem: how to determine the true value of y for hidden nodes?
 - Approximate error in hidden nodes by error in the output nodes
 - ◆ Problem:
 - Not clear how adjustment in the hidden nodes affect overall error
 - No guarantee of convergence to optimal solution

Gradient Descent

- Loss Function to measure errors across all training points

$$E(\mathbf{w}, \mathbf{b}) = \sum_{k=1}^n \text{Loss}(y_k, \hat{y}_k) \quad \text{Squared Loss:} \\ \text{Loss}(y_k, \hat{y}_k) = (y_k - \hat{y}_k)^2.$$

- Gradient descent: Update parameters in the direction of “maximum descent” in the loss function across all points

$$w_{ij}^l \leftarrow w_{ij}^l - \lambda \frac{\partial E}{\partial w_{ij}^l}, \quad \lambda: \text{learning rate} \\ b_i^l \leftarrow b_i^l - \lambda \frac{\partial E}{\partial b_i^l},$$

- Stochastic gradient descent (SGD): update the weight for every instance (minibatch SGD: update over min-batches of instances)

Computing Gradients

$$\frac{\partial E}{\partial w_{ij}^l} = \sum_{k=1}^n \frac{\partial \text{Loss}(y_k, \hat{y}_k)}{\partial w_{ij}^l}, \quad \hat{y} = a^L \\ a_i^l = f(z_i^l) = f\left(\sum_j w_{ij}^l a_j^{l-1} + b_i^l\right)$$

- Using chain rule of differentiation (on a single instance):

$$\frac{\partial \text{Loss}}{\partial w_{ij}^l} = \frac{\partial \text{Loss}}{\partial a_i^l} \times \frac{\partial a_i^l}{\partial z_i^l} \times \frac{\partial z_i^l}{\partial w_{ij}^l}.$$

- For sigmoid activation function:

$$\frac{\partial \text{Loss}}{\partial w_{ij}^l} = \delta_i^l \times a_i^l (1 - a_i^l) \times a_j^{l-1}, \\ \text{where } \delta_i^l = \frac{\partial \text{Loss}}{\partial a_i^l}.$$

- How can we compute δ_i^l for every layer?

Backpropagation Algorithm

- At output layer L:

$$\delta^L = \frac{\partial \text{Loss}}{\partial a^L} = \frac{\partial (y - a^L)^2}{\partial a^L} = 2(a^L - y).$$

- At a hidden layer l (using chain rule):

$$\delta_j^l = \sum_i (\delta_i^{l+1} \times a_i^{l+1} (1 - a_i^{l+1}) \times w_{ij}^{l+1}).$$

- Gradients at layer l can be computed using gradients at layer $l + 1$
- Start from layer L and “backpropagate” gradients to all previous layers
- Use gradient descent to update weights at every epoch
- For next epoch, use updated weights to compute loss fn. and its gradient
- Iterate until convergence (loss does not change)

Design Issues in ANN

- Number of nodes in input layer
 - One input node per **binary/continuous** attribute
 - k or $\log_2 k$ nodes for each **categorical** attribute with k values
- Number of nodes in output layer
 - One output for binary class problem
 - k or $\log_2 k$ nodes for k -class problem
- Number of hidden layers and nodes per layer
- Initial weights and biases
- Learning rate, max. number of epochs, mini-batch size for mini-batch SGD, ...

Characteristics of ANN

- Multilayer ANN are universal approximators but could suffer from overfitting if the network is too large
 - Naturally represents a hierarchy of features at multiple levels of abstractions
- Gradient descent may converge to local minimum
- Model building is compute intensive, but testing is fast
- Can handle redundant and irrelevant attributes because weights are automatically learnt for all attributes
- Sensitive to noise in training data
 - This issue can be addressed by incorporating model complexity in the loss function
- Difficult to handle missing attributes

Deep Learning Trends

- Training **deep** neural networks (more than 5-10 layers) could only be possible in recent times with:
 - Faster computing resources (GPU)
 - Larger labeled training sets
- Algorithmic Improvements in Deep Learning
 - Responsive activation functions (e.g., RELU)
 - Regularization (e.g., Dropout)
 - Supervised pre-training
 - Unsupervised pre-training (auto-encoders)
- Specialized ANN Architectures:
 - Convolutional Neural Networks (for image data)
 - Recurrent Neural Networks (for sequence data)
 - Residual Networks (with skip connections)
- Generative Models: Generative Adversarial Networks
