## **Data Mining**

## **Ensemble Techniques**

Introduction to Data Mining, 2<sup>nd</sup> Edition by Tan, Steinbach, Karpatne, Kumar

10/11/2021

Introduction to Data Mining, 2nd Edition

1

#### **Ensemble Methods**

- Construct a set of base classifiers learned from the training data
- Predict class label of test records by combining the predictions made by multiple classifiers (e.g., by taking majority vote)

10/11/2021

Introduction to Data Mining, 2nd Edition

#### **Example: Why Do Ensemble Methods Work?**

- Suppose there are 25 base classifiers
  - Each classifier has error rate,  $\epsilon$  = 0.35
  - Majority vote of classifiers used for classification
  - If all classifiers are identical:
    - Error rate of ensemble =  $\epsilon$  (0.35)
  - If all classifiers are independent (errors are uncorrelated):
    - ◆ Error rate of ensemble = probability of having more than half of base classifiers being wrong

$$e_{\text{ensemble}} = \sum_{i=13}^{25} {25 \choose i} \epsilon^i (1 - \epsilon)^{25 - i} = 0.06$$

10/11/2021

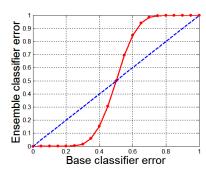

Introduction to Data Mining, 2nd Edition

3

3

#### **Necessary Conditions for Ensemble Methods**

- Ensemble Methods work better than a single base classifier if:
  - 1. All base classifiers are independent of each other
  - All base classifiers perform better than random guessing (error rate < 0.5 for binary classification)</li>

Classification error for an ensemble of 25 base classifiers, assuming their errors are uncorrelated.

10/11/2021

Introduction to Data Mining, 2nd Edition

## **Rationale for Ensemble Learning**

- Ensemble Methods work best with unstable base classifiers
  - Classifiers that are sensitive to minor perturbations in training set, due to high model complexity
  - Examples: Unpruned decision trees, ANNs, ...

10/11/2021

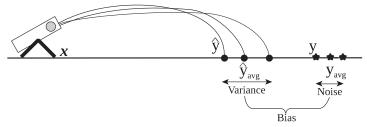

Introduction to Data Mining, 2nd Edition

5

5

## **Bias-Variance Decomposition**

 Analogous problem of reaching a target y by firing projectiles from x (regression problem)

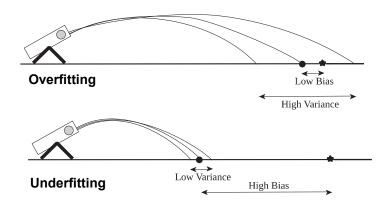

ullet For classification, the generalization error of model m can be given by:

$$gen.\,error(m) = c_1 + bias(m) + c_2 \times variance(m)$$

10/11/2021

Introduction to Data Mining, 2nd Edition

## **Bias-Variance Trade-off and Overfitting**

 Ensemble methods try to reduce the variance of complex models (with low bias) by aggregating responses of multiple base classifiers

10/11/2021

Introduction to Data Mining, 2nd Edition

7

## **General Approach of Ensemble Learning**

## **Constructing Ensemble Classifiers**

- By manipulating training set
  - Example: bagging, boosting, random forests
- By manipulating input features
  - Example: random forests
- By manipulating class labels
  - Example: error-correcting output coding
- By manipulating learning algorithm
  - Example: injecting randomness in the initial weights of ANN

10/11/2021

Introduction to Data Mining, 2nd Edition

9

9

## **Bagging (Bootstrap AGGregatING)**

Bootstrap sampling: sampling with replacement

Original Data	- 1	2	2	1	5	6	7	0	Ω	10
Original Data			J	4	5	U	-	0	Ð	10
Bagging (Round 1)	7	8	10	8	2	5	10	10	5	9
Bagging (Round 2)	1	4	9	1	2	3	2	7	3	2
Bagging (Round 3)	1	8	5	10	5	5	g	6	3	7

- Build classifier on each bootstrap sample
- Probability of a training instance being selected in a bootstrap sample is:
  - $> 1 (1 1/n)^n$  (n: number of training instances)
  - > ~0.632 when n is large

10/11/2021

Introduction to Data Mining, 2nd Edition

## **Bagging Algorithm**

#### Algorithm 4.5 Bagging algorithm.

- 1: Let k be the number of bootstrap samples.
- 2: for i = 1 to k do
- 3: Create a bootstrap sample of size N,  $D_i$ .
- 4: Train a base classifier  $C_i$  on the bootstrap sample  $D_i$ .
- 5: end for
- 6:  $C^*(x) = \underset{x}{\operatorname{argmax}} \sum_i \delta(C_i(x) = y).$

 $\{\delta(\cdot) = 1 \text{ if its argument is true and } 0 \text{ otherwise.}\}$ 

10/11/2021

Introduction to Data Mining, 2nd Edition

11

11

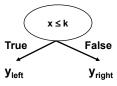

## **Bagging Example**

Consider 1-dimensional data set:

#### **Original Data:**

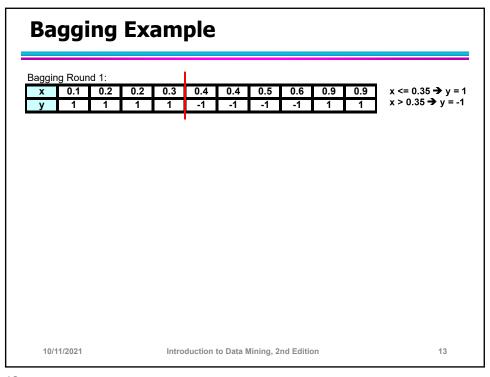

x	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1
у	1	1	1	-1	-1	-1	-1	1	1	1

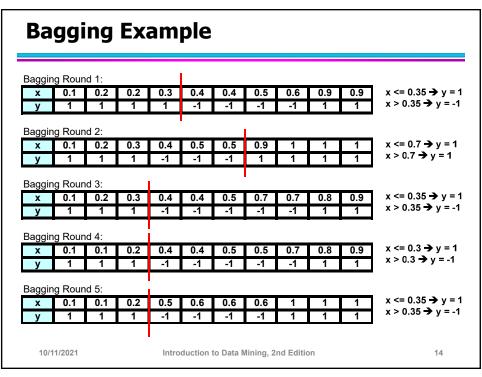

- Classifier is a decision stump (decision tree of size 1)
  - Decision rule:  $x \le k$  versus x > k
  - Split point k is chosen based on entropy

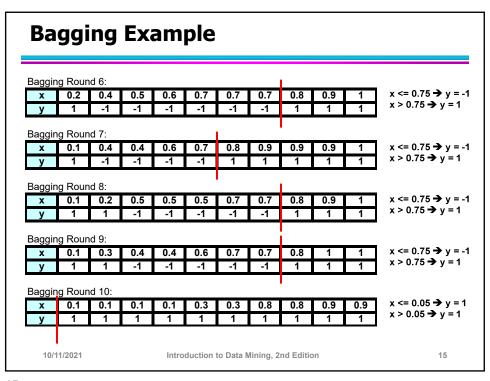

10/11/2021

Introduction to Data Mining, 2nd Edition

**15** 

## **Bagging Example**

Summary of Trained Decision Stumps:

Round	Split Point	Left Class	Right Class
1	0.35	1	-1
2	0.7	1	1
3	0.35	1	-1
4	0.3	1	-1
5	0.35	1	-1
6	0.75	-1	1
7	0.75	-1	1
8	0.75	-1	1
9	0.75	-1	1
10	0.05	1	1

10/11/2021

Introduction to Data Mining, 2nd Edition

#### **Bagging Example**

 Use majority vote (sign of sum of predictions) to determine class of ensemble classifier

Round	x=0.1	x=0.2	x=0.3	x=0.4	x=0.5	x=0.6	x=0.7	x=0.8	x=0.9	x=1.0
1	1	1	1	-1	-1	-1	-1	-1	-1	-1
2	1	1	1	1	1	1	1	1	1	1
3	1	1	1	-1	-1	-1	-1	-1	-1	-1
4	1	1	1	-1	-1	-1	-1	-1	-1	-1
5	1	1	1	-1	-1	-1	-1	-1	-1	-1
6	-1	-1	-1	-1	-1	-1	-1	1	1	1
7	-1	-1	-1	-1	-1	-1	-1	1	1	1
8	-1	-1	-1	-1	-1	-1	-1	1	1	1
9	-1	-1	-1	-1	-1	-1	-1	1	1	1
10	1	1	1	1	1	1	1	1	1	1
Sum	2	2	2	-6	-6	-6	-6	2	2	2
Sign	1	1	1	-1	-1	-1	-1	1	1	1

Predicted Class

 Bagging can also increase the complexity (representation capacity) of simple classifiers such as decision stumps

10/11/2021

Introduction to Data Mining, 2nd Edition

17

17

## **Boosting**

- An iterative procedure to adaptively change distribution of training data by focusing more on previously misclassified records
  - Initially, all N records are assigned equal weights (for being selected for training)
  - Unlike bagging, weights may change at the end of each boosting round

10/11/2021

Introduction to Data Mining, 2nd Edition

## **Boosting**

- Records that are wrongly classified will have their weights increased in the next round
- Records that are classified correctly will have their weights decreased in the next round

Original Data	1	2	3	4	5	6	7	8	9	10
Boosting (Round 1)	7	3	2	8	7	9	4	10	6	3
Boosting (Round 2)	5	4	9	4	2	5	1	7	4	2
Boosting (Round 3)	4	4	8	10	4	5	4	6	3	4

- Example 4 is hard to classify
- Its weight is increased, therefore it is more likely to be chosen again in subsequent rounds

10/11/2021

Introduction to Data Mining, 2nd Edition

19

19

#### **AdaBoost**

- Base classifiers: C<sub>1</sub>, C<sub>2</sub>, ..., C<sub>T</sub>
- Error rate of a base classifier:

$$\epsilon_i = \frac{1}{N} \sum_{j=1}^{N} w_j^{(i)} \, \delta(C_i(x_j) \neq y_j)$$

Importance of a classifier:

$$\alpha_i = \frac{1}{2} \ln \left( \frac{1 - \varepsilon_i}{\varepsilon_i} \right)$$

10/11/2021

Introduction to Data Mining, 2nd Edition

#### **AdaBoost Algorithm**

Weight update:

$$w_j^{(i+1)} = \frac{w_j^{(i)}}{Z_i} \times \begin{cases} e^{-\alpha_i} & \text{if } C_i(x_j) = y_j \\ e^{\alpha_i} & \text{if } C_i(x_j) \neq y_j \end{cases}$$

Where  $Z_i$  is the normalization factor

- If any intermediate rounds produce error rate higher than 50%, the weights are reverted back to 1/n and the resampling procedure is repeated
- Classification:

$$C^*(x) = \arg\max_{y} \sum_{i=1}^{T} \alpha_i \delta(C_i(x) = y)$$

10/11/2021

Introduction to Data Mining, 2nd Edition

21

21

#### AdaBoost Algorithm

```
Algorithm 4.6 AdaBoost algorithm.
```

```
1: \mathbf{w} = \{w_j = 1/N \mid j = 1, 2, ..., N\}. {Initialize the weights for all N examples.}
```

2: Let 
$$k$$
 be the number of boosting rounds.

3: **for** 
$$i = 1$$
 to  $k$  **do**

4: Create training set  $D_i$  by sampling (with replacement) from D according to  $\mathbf{w}$ .

5: Train a base classifier 
$$C_i$$
 on  $D_i$ .

6: Apply  $C_i$  to all examples in the original training set, D.

7: 
$$\epsilon_i = \frac{1}{N} \left[ \sum_j w_j \ \delta(C_i(x_j) \neq y_j) \right]$$
 {Calculate the weighted error.}

8: if  $\epsilon_i > 0.5$  then

9: 
$$\mathbf{w} = \{w_j = 1/N \mid j = 1, 2, \dots, N\}.$$
 {Reset the weights for all N examples.}

10: Go back to Step 4.

11: end if

12:  $\alpha_i = \frac{1}{2} \ln \frac{1 - \epsilon_i}{\epsilon_i}$ .

13: Update the weight of each example according to Equation 4.103.

14: end for

15:  $C^*(\mathbf{x}) = \underset{y}{\operatorname{argmax}} \sum_{j=1}^{T} \alpha_j \delta(C_j(\mathbf{x}) = y)$ .

25

25

## **Random Forest Algorithm**

- Construct an ensemble of decision trees by manipulating training set as well as features
  - Use bootstrap sample to train every decision tree (similar to Bagging)
  - Use the following tree induction algorithm:
    - At every internal node of decision tree, randomly sample p attributes for selecting split criterion
    - Repeat this procedure until all leaves are pure (unpruned tree)

10/11/2021

Introduction to Data Mining, 2nd Edition

#### **Characteristics of Random Forest**

- Base classifiers are unpruned trees and hence are unstable classifiers
- Base classifiers are decorrelated (due to randomization in training set as well as features)
- Random forests reduce variance of unstable classifiers without negatively impacting the bias
- Selection of hyper-parameter p
  - Small value ensures lack of correlation
  - High value promotes strong base classifiers
  - Common default choices:  $\sqrt{d}$ ,  $\log_2(d+1)$

10/11/2021

Introduction to Data Mining, 2nd Edition

27

27

#### **Gradient Boosting**

- Constructs a series of models
  - Models can be any predictive model that has a differentiable loss function
  - Commonly, trees are the chosen model
    - XGboost (extreme gradient boosting) is a popular package because of its impressive performance
- Boosting can be viewed as optimizing the loss function by iterative functional gradient descent.
- Implementations of various boosted algorithms are available in Python, R, Matlab, and more.
