REVIEW OF OpenStreetMap

The team G8 talks about OpenStreetMap (OSM) which is based on Volunteered Geographic Information (VGI).

The topic is well explained and well laid out.

Synonyms part is well thought of in case user is trying for different information and can be redirected here.

The diagram of OpenStreetMap gives a clear view of how OSM works.

Applications of OSM in GIScience is well provided with 2 scenarios.

Suggestions:

As this is encyclopedia where user is trying to find information, the components of OpenStreetMap could have been explained well through different points in hierarchical manner instead of having them in the same paragraph. This will make it easy for user.

One real example of the process of OSM might have been useful.

Information of how OSM is used in GIScience is provided. But it would be nice to include of how the OSM works in other domains too just to get an idea.
