# Ensemble Methods

---

---

- Construct a set of classifiers from the training data
- Predict class label of test records by combining the predictions made by multiple classifiers

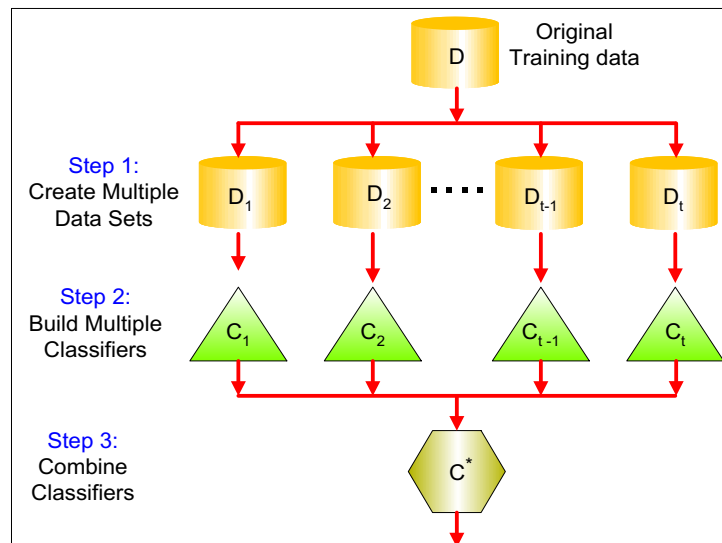

## Why Ensemble Methods work?

- Suppose there are 25 base classifiers
  - Each classifier has error rate,  $\epsilon = 0.35$
  - Assume errors made by classifiers are uncorrelated
  - Probability that the ensemble classifier makes a wrong prediction:

$$P(X \geq 13) = \sum_{i=13}^{25} \binom{25}{i} \epsilon^i (1 - \epsilon)^{25-i} = 0.06$$

## General Approach

## Types of Ensemble Methods

- Manipulate data distribution
  - Example: bagging, boosting
- Manipulate input features
  - Example: random forests
- Manipulate class labels
  - Example: error-correcting output coding

## Bagging

- Sampling with replacement

Original Data	1	2	3	4	5	6	7	8	9	10
Bagging (Round 1)	7	8	10	8	2	5	10	10	5	9
Bagging (Round 2)	1	4	9	1	2	3	2	7	3	2
Bagging (Round 3)	1	8	5	10	5	5	9	6	3	7

- Build classifier on each bootstrap sample
- Each sample has probability  $(1 - 1/n)^n$  of being selected

# Bagging Algorithm

## Algorithm 5.6 Bagging Algorithm

- 1: Let  $k$  be the number of bootstrap samples.
- 2: for  $i = 1$  to  $k$  do
- 3:   Create a bootstrap sample of size  $n$ ,  $D_i$ .
- 4:   Train a base classifier  $C_i$  on the bootstrap sample  $D_i$ .
- 5: end for
- 6:  $C^*(x) = \arg \max_y \sum_i \delta(C_i(x) = y)$ ,  $\{\delta(\cdot) = 1$  if its argument is true, and 0 otherwise. $\}$

# Bagging Example

x	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1
y	1	1	1	-1	-1	-1	-1	1	1	1

- Classifier is a decision stump
  - Decision rule:  $x \leq k$  versus  $x > k$
  - Split point  $k$  is chosen based on entropy

## Boosting

- An iterative procedure to adaptively change distribution of training data by focusing more on previously misclassified records
  - Initially, all N records are assigned equal weights
  - Unlike bagging, weights may change at the end of each boosting round

2/14/18

Introduction to Data Mining, 2nd Edition

## Boosting

- Records that are wrongly classified will have their weights increased
- Records that are classified correctly will have their weights decreased

Original Data	1	2	3	4	5	6	7	8	9	10
Boosting (Round 1)	7	3	2	8	7	9	4	10	6	3
Boosting (Round 2)	5	4	9	4	2	5	1	7	4	2
Boosting (Round 3)	4	4	8	10	4	5	4	6	3	4

- Example 4 is hard to classify
- Its weight is increased, therefore it is more likely to be chosen again in subsequent rounds

## AdaBoost

- Base classifiers:  $C_1, C_2, \dots, C_T$
- Error rate:

$$\varepsilon_i = \frac{1}{N} \sum_{j=1}^N w_j \delta(C_i(x_j) \neq y_j)$$

- Importance of a classifier:

$$\alpha_i = \frac{1}{2} \ln \left( \frac{1 - \varepsilon_i}{\varepsilon_i} \right)$$

## AdaBoost Algorithm

- Weight update:

$$w_i^{(j+1)} = \frac{w_i^{(j)}}{Z_j} \begin{cases} \exp^{-\alpha_j} & \text{if } C_j(x_i) = y_i \\ \exp^{\alpha_j} & \text{if } C_j(x_i) \neq y_i \end{cases}$$

where  $Z_j$  is the normalization factor

- If any intermediate rounds produce error rate higher than 50%, the weights are reverted back to  $1/n$  and the resampling procedure is repeated

- Classification:

$$C^*(x) = \arg \max_y \sum_{j=1}^T \alpha_j \delta(C_j(x) = y)$$

### Algorithm 5.7 AdaBoost Algorithm

```
1:  $w = \{w_j = 1/n \mid j = 1, 2, \dots, n\}$ . {Initialize the weights for all  $n$  instances.}
2: Let  $k$  be the number of boosting rounds.
3: for  $i = 1$  to  $k$  do
4:   Create training set  $D_i$  by sampling (with replacement) from  $D$  according to  $w$ .
5:   Train a base classifier  $C_i$  on  $D_i$ .
6:   Apply  $C_i$  to all instances in the original training set,  $D$ .
7:    $\epsilon_i = \frac{1}{n} [\sum_j w_j \delta(C_i(x_j) \neq y_j)]$  {Calculate the weighted error}
8:   if  $\epsilon_i > 0.5$  then
9:      $w = \{w_j = 1/n \mid j = 1, 2, \dots, n\}$ . {Reset the weights for all  $n$  instances.}
10:    Go back to Step 4.
11:   end if
12:    $\alpha_i = \frac{1}{2} \ln \frac{1-\epsilon_i}{\epsilon_i}$ .
13:   Update the weight of each instance according to equation (5.88).
14: end for
15:  $C^*(x) = \arg \max_y \sum_{j=1}^T \alpha_j \delta(C_j(x) = y)$ .
